Overall architecture

How development artifacts, production services, and model storage fit together.

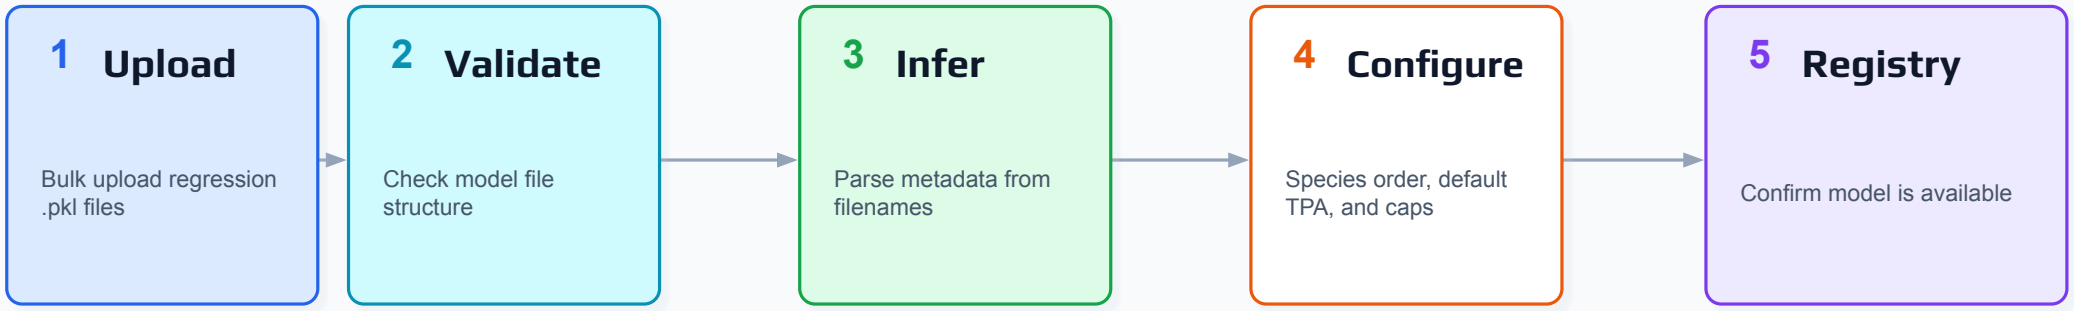

Runtime request flow

What happens when a user works in the dashboard.

Model management workflow

Development-only tools for adding models and confirming registry availability.

Inferred metadata includes variant, location code, PCT level, retention percentage, and model version. Administrators can then review the model catalog in the registry tab.

Model Management is development-only; production users access the dashboard rather than the admin model tooling.

Solver workflow

How the dashboard packages a scenario, runs the optimizer, and returns feasible treatment recommendations.
